## Syntax

- Identifying users and their groups
  - whoami
  - id
  - groups
- See file 's metadata: stat file
- Changing permissions:
  - Symbolic notation: chmod [ugoa][+-][rwx] files .
    - Adding execution permission to the owner on file: chmod u+x file.
    - Removing writing permission to the primary group on file : chmod g-w file .
    - Setting read and execution permissions to others on file : chmod o=rx file
    - Changing several permissions simultaneously on file: chmod u+w,g-x,o-r file.
  - Octal notation: chmod ddd where d represents a digit between 0 and 7.
    - --- : 0 (no permissions)
    - --x : 1 (execute only permission)
    - -w- : 2 (write only permissions)
    - -wx : 3 (write and execute permissions)
    - r-- : 4 (read only permissions)
    - r-x : 5 (read and execute permissions)
    - rw- : 6 (read and write permissions)
    - rwx : 7 (read, write, and execute permissions)
- Changing ownership on file : chown [new\_owner][:new\_group] file
  - Changing both the ownership and the group of file1 : sudo chown new\_owner:new\_group file .
  - Changing the ownership of file while maintaining its group: sudo chown new owner file .
  - Changing the group of file while maintaining its ownership: sudo chown :new\_group file .
- Running command with superuser privileges: sudo command

## Concepts

- Operating systems implement the concept of users.
- In Unix-like systems, everything is a file.
- Files have owners and group owners.

- Permissions are limits to the actions that users can perform.
- Permissions are a property of both files and users.
- To facilitate managing permissions, there is also the concept of group (of users). Groups also have permissions.
- Some users (like the superuser) have permissions to do everything.
- Users can elevate their priveleges to that of the superuser. Extra care is needed when using this power.
- In \*nix systems, users can elevate their privileges with sudo .

## Resources

- The origin of "Everything is a file".
- The setuid and setgid permission bits.
- Difference between symbolic link and shortcut
- <u>Identifying file types in Linux</u>
- POSIX standards on chmod
- The Uppercase X in chmod
- Effective user and real user
- Changing default permissions on file creation
